Polycentric Hinged Ulnar Deviation Splint

To reduce ulnar drift at the MP joints caused by rheumatoid arthritis, neurological impairment or trauma. Use following MP arthroplasty to maintain alignment after removal of post-operative splint. Recommended for ulnar drift that can be passively corrected with mild to moderate force.

The malleable finger stays may be opened to put the splint on or to take it off.

Gently contour each finger stay to create a half circle around the base of the finger. Avoid creating sharp curves in the finger stay. To prevent pressure in web spaces, stays may be rotated at their rivet attachments.

Apply wrist strap.

Splint shown on right hand.
